SYSTEM DESCRIPTION

T/3000 contains three independent generators:

- Main generator. It has six outputs: High AC current; Low AC current; Low DC current; Current impulses; High AC voltage; Low AC voltage 1.
- Auxiliary AC voltage generator 2: it generates an independent, phase adjustable AC voltage.
- Auxiliary DC voltage generator, to feed relays under test.

All outputs are adjustable and metered on the large, graphic LCD display. With the multi-purpose control knob and the graphic LCD display it is possible to enter the MENU mode, that allows to control all functions, and makes T/3000 the most powerful testing device, with manual and automatic testing capabilities, and with the possibility to transfer test results to a PC via the RS232 interface. These results can be recorded, displayed and analysed by the powerful X.PRO-3000 software, which operates with all WINDOWS versions, starting from WINDOWS 98 included.

Additional features are:

- Oscilloscope function: it is possible to display the current and voltage waveform measured;
- Two independent measurement inputs, for current and voltage, and with High and Low inputs each, allow measuring CT or VT outputs or any other source;
- The optional thermal printer gives the immediate printout of the CT saturation curve and other test results;
- An auxiliary output contact, that follows START and STOP inputs, allows simulating the circuit breaker.

The instrument is housed in a transportable aluminium box, which is provided with removable cover and handles for ease of transportation.

NOTE: WINDOWS is a trademark of MICROSOFT inc.

The current clamp allows to avoid the opening the secondary current circuit when performing the primary test of CT burden.

HIGH IDC MODULE

The high DC current module allows the measurement of the low contact resistance of high voltage breakers or of joints. The option is connected to the high AC current output of T/3000; the current measurement is connected to the low DC current measurement input; the drop voltage is connected to the low voltage measurement

input. DC current output is: 100 A steady; 200 A for 4 minutes; 400 A for 15 s.

The selection of this function is performed via menu; the screen displays: test current; joint voltage; contact resistance. Resistance measurement ranges: 100.0 uOhm, 1.000, 10.00, 100.0 mOhm; 1.000 Ohm, auto-ranging. The connection cables are included with the option.

CURRENT BOOSTER

The current booster module allows performing high current primary tests. The option is connected to the high AC current output of T/3000, and boosts the output current on two ranges: 1000 A or 2000 A. Output characteristics are the followings.

RANGE A	OUTPUT A	POWER VA	TEST DURATION
1000	500	800	4'

Current output is measured by connecting the option to the external high current measurement.

The selection of this function is performed via menu; the screen displays the output current as kA. The connection cables are included with the option.

SAFETY FEATURES AND PROTECTIONS

- Fuse on the mains supply.
- At power-on, a diagnostic sequence controls:
 - . Key microprocessor board components;
 - . Auxiliary supply voltages.
 If something is wrong, the operator is alerted by a message.
- Emergency pushbutton: if pressed, all main outputs are removed.
- The high voltage output has the following protections:
 - . Confirmation key: if not turned, the HV output is not generated;
 - . The HV is generated only if selected.
- Thermal NTC sensor on the main and auxiliary transformers. In case of over-temperature, an alarm message is displayed.
- Thermal sensors on the SCR that controls current injection, and of the internal temperature. In case of over-temperature, an alarm message is displayed.
- If maximum current limits and time duration of power transformer generators are reached, the generation is interrupted, and the operator is warned by an alarm message.
- The DC current source is protected against over-voltages. In addition, the output is automatically kept to zero as test stops, so that any residual energy on the external load is discharged.
- The auxiliary AC voltage is protected by an electronic circuit that stops the voltage generation and opens the connection to outputs socket in case of overload (short circuit included). In case of intervention, an alarm message is displayed. Via the control knob the operator can reset the alarm and close the relay to restore operation. The auxiliary AC voltage is also protected by a thermo switch that intervenes in case of over-heating. In case of intervention, an alarm message is displayed.
- The DC voltage generator is protected by a current limiter. The user notices the low voltage and removes the overload. The fuse protects the case of counter-feed.
- Re-triggering fuse on the auxiliary contact.
- Timer inputs are protected against wrong selections. If the voltage free input is selected and a voltage is applied less than 250 V ac or 275 V DC, circuits will not be damaged.
- Trip inputs and the auxiliary relay contacts are protected by devices rated 380 V AC, which limit the maximum voltage between sockets and among sockets and ground. The same protection is applied to the AC voltage 2 source, and to the DC voltage source.
- The 20 mA measurement input is protected by a thermal switch against wrong connections: in case of error the PTC goes to high impedance. The switch self-restores to the normal value in some minutes.
